"A Reticulum Cell Sarcoma with Symptoms of Hypersplenia and Panagglutination."

Warsaw-Krakow, Przegląd Lekarski, Vol 19, Ser II, No 3, [24 Mar] 63, pp 189-191.

Abstract: [Authors' English summary] A description is given of a reticulum cell sarcoma in a 27-year old single woman. The disease took the very rarely encountered form of splenomegaly, with enlargement of only one of the peripheral lymph nodes. Besides hemolytic anemia and the hemorrhagic diathesis, the patient also exhibited panagglutination, a positive Combs reaction, and a moderate degree of beta hyperglobulinaemia. The ten references contain two each French and English, and the others Polish.

Thermal decomposition of methane to carbon black.									
<p>N. M. Indukov and T. V. Frolova. <i>Carachov and RUSCH (U. S. S. R.)</i> 1968, No. 2, 37-44.—The natural Sarakhsan (Baku region) gas of the compn. CH_4 8, CH_2 69.98, C_2H_6 0.7, C_3H_8 0.35, higher unsatd. hydrocarbons 1.08%, sp. gr. 0.673, was subjected to thermal decompos. at 1000-1200° and velocity of gas feed 6, 18, 30 and 60 l./hr. The optimum temp. for CH_4 pyrolysis was 1200° and the feed 30 l./hr. (time of contact 2 sec.); then was yielded 72.5% (of the C in decomp. CH_4) of C black. The C black obtained was dark gray, and contained ash 0.06% and volatile matter 5.6%. The gas mixt., after thermal treatment, contained up to 84.7% H_2. Sixteen references. A. Pestoff</p>

<p>Decomposition of green oil and oily tar to produce carbon black. N. M. Indukov. <i>Caoutchouc and Rubber</i> (U. S. S. R.) 1968, 10, 3, 11-16. The green oil (by-product in the removal of benzene, toluene and xylene) and oily tar were decomposed at 800° in the presence of air and without air in an Fe retort. The yield of C black was, from green oil 27.7%, from tar 23%. The C black obtained contained 4% water, and 4-4.7% volatile matter. Seven references.</p>

<p>REMARKS</p>									

INDYUKOV, N. M.

Obtaining carbon black by burning the vapor mixture of middle oil and naphthalene under a metallic surface. N. M. Indyukov, T. V. Prokof'eva and M. A. Lempert. *Chemikatsiya i Tekhnika* (U. S. S. R.) 1936, No. 4, 33-6.

The mixt. of middle oil (d₄ 0.8047, flash point 69°, b. p. 150°) with 8.18 or 50% of C₁₀H₈ (m. 78-8°) was vaporized at 230-30° and then burnt in a special app. At the rate of feed of 50 g./hr. and 16% C₁₀H₈, the yield of C black was 20.1%; at the rate of 70 g./hr. and 50% of C₁₀H₈, the yield was 10.3%. A. Penttil

Details (with drawings) of the process of mfg. C blacks: Thermax (KC₁) and P-33 (KC₂) from CH₄, with the yield of av. 40% of the C in the gas, are described. The natural gas (from Baku region), contg. CO₂ 0.4-7, C₂H₆ 0-0.8, O₂ 0-0.6 and CH₄ higher hydrocarbons 92-98%, which was fed at a velocity of 5.6-46.3 cu. m./hr., was decompd. at 1100-1350° in a brick-lined and brick-filled generator, from which the decompd. gas passed the first cooler, where the temp. was reduced to 200-250° and 5% of C black was deposited, then sec. cooler, where the temp. dropped to 70-80° and 10-15% C black was deposited, and afterward the gas passed through a specially constructed filter. This filter has 3 bags, of fine linen, depositing the C black on the outside surface of the bag. The deposit was shaken down into a lower conical part of the filter chamber. The KC₁ was obtained by decompg. natural gas directly. With KC₂, the natural gas was preliminarily mixed with the waste gases and afterward fed to a generator. The optimum yield of C black, 64% of C in the gas, for KC₁ was obtained at 1250-1150° and 30 cu. m./hr. and 62.8% for KC₂ at 1200-1100° and 20 cu. m./hr. The waste gas, with KC₁ at 1200-1100°, was of the following compn.: CO₂ 0-0.2, C₂H₆ 0-0.2, O₂ 0-1.2, CO 3.8-12.8 and H₂ 75.6-82.3%. The C black obtained had H₂O up to 1.38%, ash 0.8% and sometimes higher, comprising rust from coolers and filter chamber, volatile matter up to 1.80%, oversize on the standard screening tests less than 0.8%, the vol. in dry condition for KC₁ 1.5 and for KC₂ 6 cc., and in C₂H₆ (Galenha) 2.5 and 15 cc., resp. The results, in graphs, are given for the series of tests, made to compare the behavior of different proportions (20, 40, 60, 80 and 100% by wt. of the rubber) of KC₁, KC₂, and Thermax in vulcanizates. The elasticity and the resistance to wear off of the vulcanizates with KC₁ and KC₂ are lower than those with Thermax; the tensile strength, hardness, modulus at 200% and plasticity are of the same values, as those with the Thermax. TITLE: Catalytic Refining of Thermally Cracked Kerosine
PERIODICAL: Khimiya i tekhnologiya topliv i masel, 1961, No. 2,
pp. 16-20

TEXT: Laboratory and pilot plant experiments have been prepared and conducted on refining thermally cracked kerosine over an aluminosilicate catalyst. The intention was to increase the output of diesel fuels, and previous refining treatments, such as hydrostabilization, acid washing, and hydrogenation, have not proved satisfactory. The kerosine raw material obtained at the Zavod imeni V. Sturua (Plant imeni V. Sturua) was as follows:

Specific gravity d_4^{20}	0.8504
Composition, °C:	
I.B.P.	174
10% Vol. boiling up to	203
50% " " " "	237
70% " " " "	250

Card 1/6

Catalytic Refining of Thermally Cracked Kerosine

The space velocity was 0.7 kg/kg hr for temperatures of 330 and 300°, and 1 kg/kg hr at all others. Although the highest output is obtained at 240°C in the presence of added water vapour, the acid value is high (11.7), and lower values are obtained (5.5 to 6.9) without added water. Optimum working conditions are thus 260-300°C, and 0.7 to 1 kg/kg hr space velocity. Pilot plant results (with fluid bed, and 10 to 12% water added) are also tabulated. The mass balance at the optimum conditions of 260-300°C and 1 kg/kg hr are as follows:

Catalyst	91-92
Polymer	2.8-2.9
Gas	0.8-1.0
Coke	2.9-3.0
Loss	1.20-2.3

The catalyzate would satisfy diesel oil specification BTY 586-56 (VTU 586-56), except for flash point, but removal of the 12% fraction boiling up to 165°C overcomes this as shown:

TITLE: Hydrocarbons of the naphthalene series in naphtha and gas oils from catalytic cracking

PERIODICAL: Khimiya i tekhnologiya topliv i masel, no.1, 1963, 16-19

TEXT: Alkyl naphthalenes were isolated from naphtha and light and heavy gas oils from catalytic cracking to satisfy the increasing industrial demand for phthalic anhydride. The naphthalene hydrocarbons were isolated from aromatic portions of the oils separated on silica gel and distilled to produce 10°C cuts. Alkyl naphthalenes in the cuts were separated via picrate formation. The naphtha fractions contained naphthalene (0.59% of the original naphtha), β -methylnaphthalene (3.66%), 1,6-dimethylnaphthalene (2.15%). The light gas oil fractions contained dimethylnaphthalenes (2.05%) and trimethylnaphthalenes (2.43%). The heavy gas oil fractions contained dimethylnaphthalenes (3.3%), trimethylnaphthalenes (1.38%) and tetramethylnaphthalenes (1.12%). There are 5 tables.

TITLE: The construction of the electromagnet for the 7 GeV
proton synchrotron

PERIODICAL: Priroda i tekhnika eksperimenta, no.4, 1962, 15-19

TEXT: A description is given (including sectional drawings) of the electromagnet. The electromagnet incorporates four types of magnetic sections, namely: 1) bending sections for radial focusing (total number 42), 2) bending sections for radial defocusing (total number 53), 3) bending sections for radial defocusing, located at points of beam extraction (total number 3), and 4) quadrupole lenses with zero field on the orbit (total number 14). The magnetic circuits of all the sections are assembled from insulated steel sheets (the chemical composition of the steel is similar to E2 steel). The hyperbolic pole faces were made on a special milling machine and have a curvature of 2780 cm in the horizontal plane. The system used to retain the

Card 1/3

The construction of the ...

S/120/62/000/004/002/047
EO32/E514

steel sheets in position was such that the deformation of the hyperbolic face was $\pm(0.1-0.15)$ mm after two days and ± 0.03 mm after two months. The design of the neutral pole faces of the bending magnets was such that their deformation and the electrodynamic stresses did not exceed 0.05 mm. The main winding consists of 48 turns connected in series and arranged in ten sections. The winding is made of rectangular copper piping which was manufactured by the Leningrad factory "Krasnyy Vybortzhet". In addition to the main winding, there are three compensating coils which are used to correct the magnetic field. Water cooling is used and the insulation is sufficient to withstand 2 kV. The extracting magnets, which are used to extract the beam into the experimental area, consist of a main coil (8 turns; copper piping) and two compensating coils (8 turns each; copper piping). Finally, the quadrupole lenses carry an 18 turn main winding and an 18 turn auxiliary winding, both in the form of copper piping. In order to facilitate the positioning of all the electromagnets, each of them carried special markers which were used to relate their position to the appropriate points

Card 2/3

The construction of the ...

5/120/62/000/004/002/047
E032/E514

on the basic geodesic grid. Special mechanisms were used to adjust the magnets. They can be adjusted by ± 2 cm in the vertical plane to an accuracy of 0.001 cm and by ± 8.5 cm in the radial direction to an accuracy of 0.002 cm. The former adjustment is made with the aid of special wedges and the latter by a screw-driven mechanism. The azimuthal adjustment is made by simple wedge devices and can be achieved to an accuracy of ± 0.05 cm. There are 6 figures.

TITLE: On the Catalytic Properties of the System Pt - Au (O
kataliticheskikh svoystvakh sistemy Pt - Au)

PERIODICAL: Zhurnal fizicheskoy khimii, 1959, Vol 33, Nr 5,
pp 983-987 (USSR)

ABSTRACT: The data by publications on the system mentioned in the title (Refs 4-11) are discussed, and it is referred to the X-ray investigations by K. A. Lapteva, T. I. Borisova, and M. G. Slin'ko (Ref 11). According to these investigations, platinum-gold alloys with 5.04 and 9.5 atm% Au are one-phase, and alloys with 20, 30, 39, 59, 63, and 87 atm% Au are two-phase. The measuring apparatus for the catalytic hydration process is described in reference 2. 0.01 g Pt or Au were used in the investigation of catalytic activity, and quantities with a Pt content of 0.01 g were used in the case of Au and Pt catalysts. The ratio platinum : gold in the catalysts was varied from 99:1 to 1:3. Hydrogen and benzene in the ratio of 1:4

throughput of 1.5 l H/h. Figure 1 shows the temporal variation

of the Pt and Pt-Au catalysts investigated. Hence it appears that the activity decreases in the beginning but then remains constant. Figure 2 shows the variation of the activity of Pt and Pt-Au catalysts depending on the gold content. The activity increases with small gold additions, reaches a maximum with 5 % Au ($2\frac{1}{2}$ times the activity of pure Pt), and then decreases continuously. A catalyst with 75 % Au is completely inactive. It might be that the activity increase observed with an addition of up to 5 % Au is related to the increase of the active surface which covers the actual activity decrease. Otherwise it would be inexplicable why a catalyst with only 25 % Pt is completely inactive. The authors had already earlier assumed (Refs 1 and 2) that there is a relation between the magnetic properties of the catalysts investigated by them, and the catalytic activity of the catalysts. They point out that according to data from publications (Ref 6) the paramagnetism of the Pt-Au alloy with 68-70 % Au content equals zero. If gold is added, the amount of holes in the d-zone of the alloy and together with it the catalytic activity must decrease. The authors found similar relations in connection with the

Card 2/3

On the Catalytic Properties of the System Pt - Au

SOV/76-33-5-4/33

other catalysts investigated by them. The fact that Pt-Au catalysts react differently on oxydation of SO_2 (Ref 13) can be thus explained that platinum as well as gold are active towards SO_2 which is not true for the hydrogenation of benzene. The solubility of hydrogen in the system varies if gold is added and, there seems to be a direct relation between this solubility and the catalytic activity. There are 2 figures and 16 references, 9 of which are Soviet.

TITLE:

On the Catalytic Properties of the System Pd + Pt

PERIODICAL:

Zhurnal fizicheskoy khimii, 1959, Vol 33, Nr 7, pp 1467 - 1472
(USSR)

ABSTRACT:

It was already found (Refs 1-5) that there is a certain relationship between the catalytic and magnetic properties of catalysts (C). In the present paper, the authors investigated the catalytic activity of mixed Pd + Pt (C) with respect to benzene hydrogenation, and compared the experimental results with data available in publications on the magnetic properties of these systems. The activity of the (C) was determined from the rate of benzene (I) hydrogenation to cyclohexane (II). The apparatus used is similar to that of (Refs 15 and 16). The catalysts were prepared by the method (Ref 17). The ratio of Pd to Pt was modified within the range 1 : 10 - 10 : 1. The experimental results (Table 1) indicate that with increasing Pt content the activity of the (C) attains a minimum and then rises again. A small content of Pt in Pd or of Pd in Pt causes mutual activation of Pd and Pt, respectively. It was observed that the catalytic activity at the Pd - Pt ratios investigated never drops

Card 1/2

On the Catalytic Properties of the System Pd + Pt

SOV/76-33-7-4/40

to zero. This is ascribed to the fact that the magnetic susceptibility does not attain zero either at none of the above ratios. The minimum catalytic activity, determined at the ratios of Pd: Pt = 1:1 - 1:2, coincides with the minimum value of magnetic susceptibility of the alloy. Hydrogen, silver, and copper cause Pd to act in a similar way upon the magnetic and catalytic properties, i. e. the paramagnetism (P) of Pd as well as its catalytic activity with respect to (I)-hydrogenation are eliminated. Additions of Pt to Pd, however, do not destroy (as mentioned above) (P) and the catalytic activity. Additions of gold destroy (P) in Pd, but do not effect the catalytic activity. This is ascribed to excitation and splitting of the electron spin by the reaction heat. The catalytic activity is thus maintained. There are 3 figures, 2 tables, and 19 references, 10 of which are Soviet.

TITLE:

On the Equivalence of Nitrogen Bonds in Tetramethyl-Ammonium Bromide (O ravnotsennosti svyazey azota v bromistom tetrametilammonii)

PERIODICAL:

Izvestiya Akademii nauk SSSR. Otdeleniye khimicheskikh nauk, 1959, Nr 1, pp 174 - 174 (USSR)

ABSTRACT:

According to modern concepts the 4 nitrogen bonds in $(\text{CH}_3)_4\text{NBr}$ formed by sp^3 bastardization are equivalent. In the present paper the authors checked these data. $(\text{C}^{14}\text{H}_3)(\text{CH}_3)_3\text{NBr}$ was synthesized according to the following scheme:

The last process took place at -80° . Furthermore, the product obtained was decomposed in liquid ammonia solution. The

Card 1/2

On the Equivalence of Nitrogen Bonds in Tetramethyl-
Ammonium Bromide

SOV/62-59-1-33/38

following reaction took place in the solution:
 $(\text{CH}_3)_4\text{NBr} + 2\text{K} + \text{NH}_3 \rightarrow \text{CH}_4 + (\text{CH}_3)_3\text{N} + \text{KBr} + \text{KNH}_2$. The results of
the investigation are summarized in the table. It may be
seen from it that methane separated during the decomposition
of the ternary salt possesses 23% of the activity, whereas
trimethyl amine possesses 78%. Thus, the experiments carried
out at -80° confirmed the conclusions of the paper (Ref 1)
and the generally assumed idea of the equivalence of the
bonds of quadrivalent nitrogen. There are 1 table and 2
references, 1 of which is Soviet.

TITLE: Formation of Conjugate Diene Amines During the Interaction
of Mono- and Diquaternary Salts of 1,4-Diamines With
Aqueous Alkali

PERIODICAL: Doklady Akademii nauk SSSR, 1960, Vol. 133, No. 6,
pp. 1334-1336

TEXT: The authors report on their investigations of the reactions of
mono- and diquaternary salts of 1,4-di-(dimethyl-amino)-2-methyl butene-2.
They attempted to find out whether the double 1,4-cleavage of the di-
ammonium salt takes place simultaneously or by steps. The authors proved
that the protonization of the hydrogen atoms of C₄ is suppressed by the
conjugation of the methyl group. Thus, the order of the mentioned
cleavage reactions is predetermined according to scheme (I). ✓

Card 1/6.

Formation of Conjugate Diene Amines During

Scheme A

S/020/60/133/006/027/031XX
B016/B054

This statement by the authors is based on the results of their experiments. From the products of the reaction of the iodine salt of 1,4-di-(trimethyl-ammonium)-2-methyl butene-2 with aqueous alkali, they isolated an aldehyde (corresponding to the dimer of methyl crotonic aldehyde), as well as a high-boiling amine product (apparently a condensation product of methyl crotonic aldehyde with 1-dimethyl-amino-(methyl)-butadiene). The same

B016/B054

result was obtained in the transition from a mixture of quaternary ammonium salt with alkali to an ammonium base. The authors did not succeed (contrary to a statement made by Ya. M. Slobodin, Ref. 5) in detecting even traces of 2-methyl vinyl acetylene in the reaction products. This fact speaks in favor of scheme I. The authors further cleft the monoiodo methyl derivative of 1,4-di-(dimethyl-amino)-2-methyl butene-2 by aqueous alkali at a lower temperature (120°C). Here, the same products were formed as in the cleavage of the diquaternary salt. Subsequently, the authors cleft - in vacuo and at 105-107°C - the hydroxide they had produced by treating the monoiodo methylate of 1,4-di-(dimethyl-amino)-2-methyl butene-2 with an aqueous suspension of the silver oxide. Here, they isolated 1-dimethyl-amino-2-methyl butadiene-1,3 (yield about 40% of the theoretical one). The properties of this substance are described. From the fact that this substance forms dimethyl amine, as well as a corresponding derivative of α -methyl crotonic aldehyde, with the solutions of semicarbazide, 2,4-dinitro-phenyl hydrazine, and hydroxylamine, the authors conclude that the methyl in the diene amine takes a β -position with respect to the amino group:

Card 3/6

the Interaction of Mono- and Diquaternary
Salts of 1,4-Diamines With Aqueous Alkali

S/020/60/133/006/027/031XX
B016/B054

consequently, the position of the methyl in the monoiodo methylate used is:

On the basis of these results, the authors assume that the second cleavage step of diiodo methylate (step (a) of scheme I) requires a higher temperature (140-145°C) than was hitherto applied. To settle this question, they studied the behavior of two other diquaternary ammonium salts (I) and (II) towards aqueous alkali. It was proved that the alkaline cleavage of (I) already occurred at the temperature of the boiling water bath (see scheme B). The similar cleavage of (II) is illustrated by scheme C. Thus, the authors proved that the diquaternary ammonium salts (I) and (II) are cleft by alkali according to scheme I, i.e., exclusively via step (a) (see scheme A). There are 5 Soviet references.
